

PARKER

B300-MR Series Contour Probe

The B300-MR Contour Probe is a rugged high performance instrument for magnetic particle inspection. This unit produces a strong AC field and includes Parker's original flexible leg design that allows the field to be "focused" at a precise area of inspection.

The B300-MR contains electronic circuitry that is sealed within the housing of the instrument. The external push button switch magnetically activates the power circuit from the outside. There is no electrical contact between the switch and internal circuit. This instrument is also equipped with an internal thermal cutoff that will shut down the device if overheated. The instrument will automatically reset itself when the temperature drops. This new innovative switch offers improved operator safety plus durability and is ideally suited for high moisture area applications. Comes with our one year guarantee.
